Note: Most Forward-phase dimmers have a minimum load requirement of 40-60 watts. A single 12.5W LED lamp on a 600W dimmer may flicker if the minimum load requirement is not met; consider a synthetic minimum load, LUTRON-LBX or other equivalent. This requires a 2-gang wall box and additional wiring to the dimmer.

Depending on the quantity of LED lamps on the dimming circuit, an approximate 10% to 100% dimming range may be obtainable. Most available dimmers were designed around older technology and resistive or incandescent lamp loads; therefore, performance can vary with LED load and is not guaranteed. Please see the manufacturer's instructions on dimmers for use with LED lamps and do not exceed the 150W LED load for 600W rated dimmer.

REPLACEMENT CHART

Acculamp LED—20 Amp Circuit Load

Use the table below as a guide, for the approximate quantity of Acculamp LED lamps on a typical standard 20 amp circuit (derated to 80% - 16 amps). Use a licensed electrician to determine proper wire gauges and circuit breakers according to the National Electrical Code and local codes. Do not overload circuit with more lamps than the approximate quantity shown below for a typical standard 20 amp circuit breaker for approximately 7X multiple of inrush current. Circuit breakers with higher inrush trip curve characteristics such as **High Magnetic** types are available. Consult with a licensed electrician for proper determination.
